

SCOPE OF WORK

Caddie AI

Platform Migration + Native Apps + Affiliate Program

Prepared by: SpringCode

Date: May 2026

OVERVIEW

What We're Doing

Three deliverables: migrate Caddie AI off Base44 onto your own infrastructure (Supabase + Vercel), wrap the web app as native iOS and Android apps with Capacitor and publish to both app stores, and build an affiliate tracking system for influencer partnerships.

After migration, you will have full control over your codebase, database, AI provider, and deployment pipeline. The native apps will use RevenueCat as the single subscription management layer across web (Stripe), iOS (Apple IAP), and Android (Google Play Billing). The affiliate system will track influencer-driven conversions across all platforms.

PROJECT SCALE

What's Being Migrated

Metric	Count
Entities (database tables)	21
Total fields across all entities	~205
Serverless functions (Deno)	41
Frontend source files	185

Metric	Count
Pages	33
Frontend LLM call sites (InvokeLLM)	9
Backend LLM call sites	5
Stripe billing functions	14
Frontend function invocations	25 distinct functions

INTEGRATIONS

Third-Party Services

- Stripe - subscription billing (14 backend functions, hosted checkout, customer portal). Stays as the web payment processor under RevenueCat.
- RevenueCat - unified subscription management across web (Stripe), iOS (Apple IAP), and Android (Google Play Billing). Client sets this up on the current Base44 app before migration.
- Anthropic Claude - AI coaching engine. Currently proxied through Base44's InvokeLLM. Will be replaced with direct Anthropic API calls. 14 call sites total (9 frontend moved server-side + 5 existing backend).
- Email provider (Resend) - magic-link authentication delivery. Currently handled by Base44. Needs a provider wired in.

DELIVERABLES

What Gets Built

Base44 Migration

- Set up Supabase project with full database schema (21 entities, ~205 fields, RLS policies re-implemented from Base44's embedded rules)
- Replace all Base44 SDK calls across 185 source files with native Supabase client calls (18 entities x CRUD + 25 function invocations + auth surface)
- Port all 41 Deno serverless functions to Supabase Edge Functions
- Replace Base44 auth (magic-link) with Supabase Auth + Resend for email delivery

- Replace Base44 InvokeLLM proxy with direct Anthropic API calls. All 9 frontend LLM calls moved server-side to Edge Functions. Prompts and JSON schemas preserved.
- Replace Base44 file upload with Supabase Storage (profile photo upload)
- Deploy frontend to Vercel with GitHub CI/CD and custom domain (caddieaiapp.com)
- Migrate existing data from Base44 (export and import with relationship preservation across 21 entities)
- Re-point Stripe webhook endpoint from Base44 to Supabase
- Re-point RevenueCat webhook endpoint from Base44 to Supabase
- Remove Base44 Vite plugin and builder integrations

Native Apps (iOS + Android)

- Capacitor scaffolding for iOS and Android projects
- RevenueCat Capacitor SDK integration for in-app purchases (Apple IAP on iOS, Google Play Billing on Android)
- App Store compliance: no in-app credit card collection on iOS. Paid signup through Apple IAP (via RevenueCat) or external web checkout (Stripe). Existing APP_STORE_COMPLIANCE.md rules preserved.
- Native plugins: Browser (for external Stripe checkout links and deep-link back), Camera (for profile photo upload), Preferences (local storage), App (lifecycle events)
- Deep-link and universal-link handling for returning from external Stripe checkout and referral links
- Hardcoded Stripe Checkout and Billing Portal URLs updated with conditional handling under Capacitor (open in external browser, deep-link back to app)
- Splash screen and app icon assets for both platforms
- Build, sign, and submit to Apple App Store and Google Play Store

Push Notifications

- Firebase Cloud Messaging (FCM) for Android push notifications
- Apple Push Notification service (APNs) for iOS push notifications via Capacitor
- Wired into existing Notification entity and /notifications preferences page

Affiliate Tracking System

A custom-built affiliate tracking system for influencer partnerships, designed to work with RevenueCat so conversions are tracked across all platforms (web, iOS, and Android) including Apple IAP purchases.

- Affiliate table in Supabase (name, unique code, commission type, commission rate, payout details, status)
- Unique tracking links per influencer (caddieaiapp.com?ref=golfpro)
- When a user signs up via an affiliate link, the affiliate_id is stored on their UserProfile and set as a RevenueCat subscriber attribute
- RevenueCat webhook fires on every subscription event (new, renewal, cancellation). Edge Function looks up the subscriber's affiliate, calculates commission, writes to a commissions table.
- Per-affiliate commission configuration (percentage of revenue or flat fee per signup, adjustable per influencer)
- Admin dashboard page: performance per affiliate (signups, conversions, active subscribers, revenue generated, commissions owed, payout status)
- Affiliate stats page: influencers can see their own performance (clicks, signups, revenue, commission earned)
- Payouts tracked in the system, marked as paid manually by admin. Actual payment made via PayPal, Wise, or bank transfer outside the app.

PAYMENT STRATEGY

RevenueCat as Single Source of Truth

RevenueCat manages all subscriptions across every platform. Your app only ever asks RevenueCat whether a user has access. It never checks Stripe or Apple directly.

- Web: user subscribes via RevenueCat (which uses Stripe for payment processing). Stripe handles the card charge, RevenueCat tracks the subscription.
- iOS: user subscribes via RevenueCat (which uses Apple IAP). Apple handles the charge, RevenueCat tracks the subscription.
- Android: user subscribes via RevenueCat (which uses Google Play Billing). Google handles the charge, RevenueCat tracks the subscription.
- Cross-platform: user subscribes on web, opens the iOS app. RevenueCat knows they're a subscriber. No duplicate charges, no sync issues.

The existing subscription state machine (trial, basic, pro, expired) stays, but the source of truth moves from your database to RevenueCat. Your database stores a cached copy that the RevenueCat webhook keeps in sync.

Pre-Migration: Set Up RevenueCat on the Current App

Before migration begins, we recommend setting up RevenueCat on the current Base44 app. This means that when the influencer posts go live, all new signups come through RevenueCat from day one. When the migration happens, RevenueCat is already the source of truth and we just re-point the webhook endpoint. No subscriber migration needed.

This setup is the client's responsibility and should be completed before the migration engagement begins.

PRICING

Investment

Deliverable	Price
Base44 migration (21 entities, 41 functions, SDK swap across 185 files, auth + email provider, LLM proxy replacement, Stripe/RevenueCat webhook re-pointing, storage, data migration, Vercel deployment)	\$1,200
Native apps - iOS + Android (Capacitor wrap, RevenueCat IAP integration, deep-links, splash/icons, App Store + Play Store submission)	\$800
Push notifications (FCM + APNs via Capacitor)	\$200
Affiliate tracking system (custom built, works with RevenueCat across all platforms, admin dashboard, affiliate stats page, commission tracking)	\$400

Total: **\$2,600**

Payment: \$500 deposit before work begins, followed by 3 monthly payments of \$700 after migration is complete.

Monthly Retainer (Optional)

Tier	What's Included	Price
Standard	Bug fixes, guidance, monthly code review	\$250/month

ONGOING COSTS

Infrastructure (Paid by You)

- Supabase Pro: \$25/month (database, auth, storage, daily backups)
 - Vercel: Free tier covers most apps. Pro plan is \$20/month if needed
 - RevenueCat: Free up to \$2,500/month in tracked revenue. 0.8% of revenue after that.
 - Anthropic API: pay-per-use for coaching features. Cost depends on usage volume.
 - Resend: Free tier covers 3,000 emails/month. \$20/month for 50,000 emails.
 - Apple Developer Program: \$99/year (required for App Store)
 - Google Play Developer: \$25 one-time (required for Play Store)
-

FROM YOU

What We Need to Get Started

- GitHub repository access (add silexdev as a collaborator)
 - A Supabase account created at supabase.com with admin@silexdev.com invited as admin
 - Anthropic API key
 - RevenueCat account set up with Apple App Store and Google Play Store connected
 - Apple Developer account (\$99/year) with App Store Connect configured
 - Google Play Developer account (\$25 one-time) with Play Console configured
 - Data export from Base44 (CSV or JSON for all 21 entities)
 - App icon and splash screen assets (or source files for us to generate)
 - Custom domain (caddieaiapp.com) DNS access for pointing to Vercel
-

TIMELINE

Estimated Delivery

3 weeks from when we receive access

Note: App Store review can take 1-7 days after submission. Google Play review is typically 1-3 days. These timelines are outside our control.
